Role & Scope

Lead Product Designer

I led conversational search design for Alexa Audio across mobile, web, smart speakers, and TV, partnering with a voice designer to shape the early interaction model. The work bridged natural language, touch, and existing interfaces, defining how Alexa would surface results, follow up, and recover from misunderstandings at the start of the generative AI era.

- CONTRIBUTIONS
- Conversational UX
 - Generative AI patterns
 - Design System contributions

Problem

Alexa had a midlife crisis

Customers had to use precise voice commands to find audio content, with minimal visual feedback. LLMs like ChatGPT changed expectations: people wanted natural conversation.

"It's really good when I know exactly what I want and what to say, but when I don't, it's terrible."

Research participant, music & podcast study

Solution

Use natural language to discover your next favorite listen

A visual layer that pairs with voice, surfacing results, follow-ups, and context as the conversation unfolds.

An interface that's there when you need it...

Conversational queries surface rich visual results. Drove a 20% engagement lift.

What's the band with the
guy from stranger things?

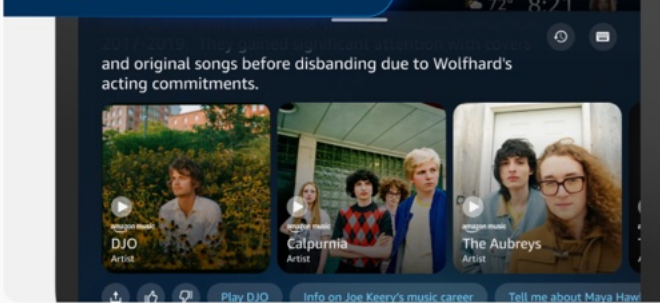

...and fades into the background when you don't

Direct playback when you know what
you want. Protected listening minutes.

I found a few bands with actors from Stranger Things...

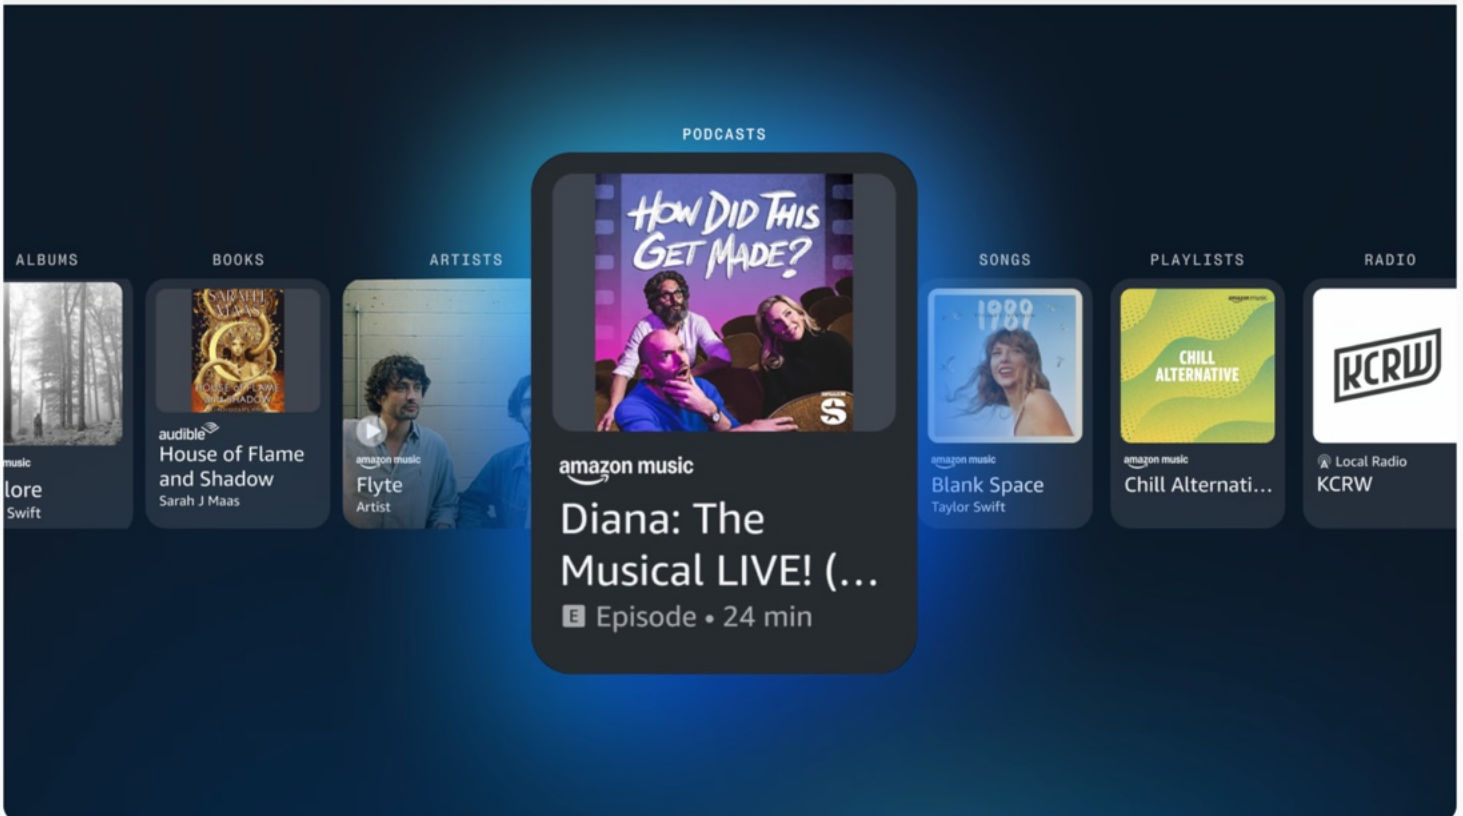

Here's Delete Ya, by DJO.

Scalable card system across all content types

Built flexible components that adapt to different content needs.
Scalable design saved 60 dev weeks and improved browse.

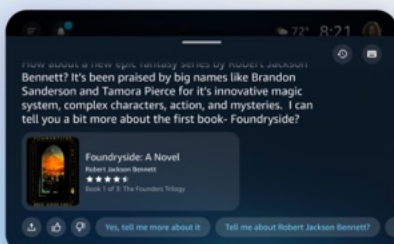

From noise to value: a framework for effective related content

Related results framework minimized cognitive load. Contributed to a 67% engagement increase for recommendations users.

Before: Limited Discovery

Search responses surfaced only the primary item, limiting exploration and discovery.

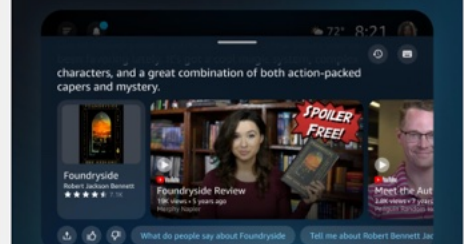

Misapplied: Too much noise

Partner team overloaded responses with tangential, low-value items, reducing trust.

Refined: Hyper-relevant content

Applied strict quality filters to surface fewer, higher value items.

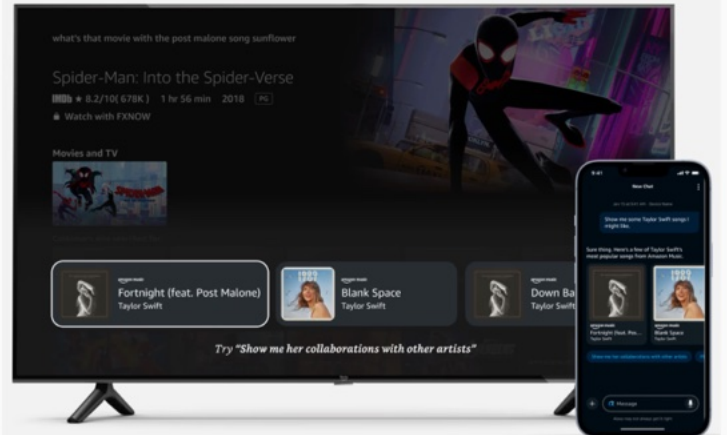

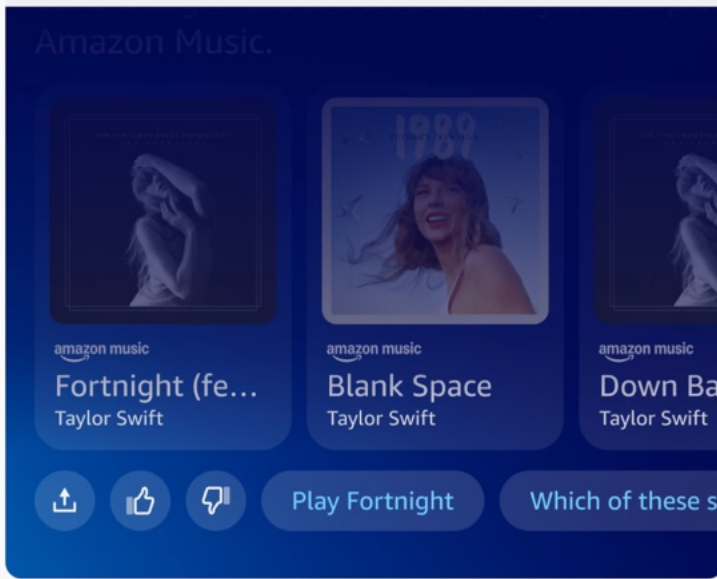

Smart suggestions that extend the conversation

Customers didn't know what to ask the new Alexa. Suggestion pills surfaced relevant follow-ups.

Unified experience across mobile, TV, and web

Adapted for each platform's strengths while maintaining consistency.

Impact

Reduced friction, increased engagement

ENGAGEMENT

20%

increase in listening hours

USABILITY

6%

below CPDR target

RESOURCE SAVINGS
